## Laborator 0×04

- 1. Apelarea functiiler
   PRINTF (function FFLUSH)
   SCANF
- 2. Suma a douā m. citite de la tostatura
- 3. Matrice
  - Afinare
  - Suma el. pare
  - litre

# Apularea functii lor prints ni neans dintr-un program mis in limbej de asamblare

#### PRINTF

### Exemple purgram

pop 1. els

. data

format Print : . orig " / d : / d"

. global main

main:

push \$1

rush \$0

push \$ format Print

ftmen blos

por 1. dx

por 1. ela

pop 1. elx

push \$0

coll fflush // goleste buffer-ul went in cone

por 1. elx

mor \$1, 1 wax

mor \$0, " els

int \$0 + 80

#### SCANT

rong (" "d", & 2)

push \$ x // monf un na puna volvorea citilà la adusa de memorie a

rush \$ format

call many

non 1. ela

pon 1 elex

Exemple program

. data

x: . mac 4

format Int: . oniz " 1 d"

. text

. global main

main :

11 monf (" 1 d", &x)

push \$ x

push & format Int

call monf

pop 1 ebx

por 1 dx

et . wit

nov \$1, 1 eax

mor \$0, 1 dx

int \$0 x 80

# Suma a dona numere citite de la tostatura

. data

x: . mare 4

y: . mace 4

format Read: anit " 1. d 1. d"

fromat Print: arrig " Suma m. este 1. d \n"

. text

. global main

main :

11 monf ( 1 du 1 d, 12, 29)

rush \$ y

rush \$ x

push & format Read

call many

pop 1. elx

pon 1 dx

ron 1 da

11 con = x + y

mor x, 1. cax

odd y, 1 war

ruch \$0 call fflush pon 1. clx

mor \$1, 1. cax
mor \$0, 1. cbx
int \$0 x 80

### Matrie

- vor fi storate in memorie tot ca o zona continua

- elementele ur fi accesate prin intermedial a doi indesi

lines: long 3

whenes: . Long 4

line Index : . you h

when Index: . more

1. ed + 4 + 1. es

La matrici

1 edi

line Index

cine este 1. ers in function

column Index

(1. edi, 1. ers, h)

column Index

columns

I eex = line Index \* whemms + whem Index

Exemple program: Afisarea une matrici

. data

lines: . long 3

whenes: . long 4

line Index: . space 4

when I note: . more h

matrix: . Long 100, 20, 30, 40

. long 50, 60, 70, 80

. long 30, 15, 25, 35

format Int : . aniz " 1 d u "

nur line : . only "In"

. text

. global main

```
lea matrix, 1 edi
       more $0, line Index
     for ( int line Index = 0; line Index 4 lines; line Index ++)
         for ( int column Index = 0; column Index < column; column Index + +)
for - lines :
      moul line Index, " ex
     ung I ux, lines
     je et-mit
     more $0, whem Index
     for _ when :
             mool whem Index, " ex
             ung 1 ecx, whemmer
             je cont_for_lines
              // preh varea efectiva
              // elementul ament este la
              line Index * whenmy + whem Index relation la
              adusa de majuit a matrici , i.e. relation la 1/ edi
              11 toate elementele sunt. long => au dim h B
               more line Index, I wax
               mull whenes
                addl whem Index, " ear
                more (t. edi, t. eax, h), t. ebx
```

11 in 1 cla se affa elemental ament din matrice

#### wort - for - lines :

mov \$ 1, 1. cax

mov \$ 1, 1. clx

mov \$ new line, 1. cex

mov \$ 2, 1. cdx

int \$ 0 x 8 0

addl \$1, line Index

jmp for - lines

#### et\_exit:

morel \$1, 4 cox

morel \$0, 4 chx

int \$0 x 80
